DETAILED ACTION

Response to Arguments

Applicant's arguments with respect to the claims have been considered but are moot in view of the new ground(s) of rejection. It is also noted that the dependent claims have not been separately argued such that their patentability stands or falls with the parent claims.

Claim Objections

Claim 24 is objected to because of the following informalities: in line 2, shouldn't 'on' be changed to --one--? Appropriate correction is required.

Claim Rejections - 35 USC § 103

Claims 1,4-6,9-18,21-33 are rejected under 35 U.S.C. 103(a) as being unpatentable over Paules. This patent shows several grinding and separation steps for waste material. At least three of the separating steps shown are specifically said to be performed by an air leg separator; see elements 32,72,78. Paules does not disclose plastics as being part of the waste refuse. However, it is well known in the art that plastics are a known refuse, and their recovery for recycling purposes is also well known in the art. Therefore, in order to recycle plastics, it would have been obvious for one of ordinary skill in the art to modify Paules by recovering plastics since plastics is a well known waste material and would currently be part of a typical waste combination. The remaining limitations would then have been obvious design choices only. For example, providing mobility for waste apparatus is well known in the art and of no

patentable merit. Also, the particular type of material recovered would depend on several factors such as material being treated.

Claims 1,4-6,9-18,21-33 are rejected under 35 U.S.C. 103(a) as being unpatentable over the admitted prior art (APA) in view of Paules. APA is discussed on the first few pages of the specification which is method and apparatus for treating waste material including plastics. No air leg separators are used to help perform the separation steps which leads to inefficient process steps. Paules solves this problem by disclosing similar process and apparatus including the use of an air leg separator to perform various separation steps. In order to efficiently separate material, it would have been obvious for one of ordinary skill in the art to modify APA by using an air leg separator, taught to be desirable by Paules. The remaining limitations would then have been obvious design choices only. For example, providing mobility for waste apparatus is well known in the art and of no patentable merit. Also, the particular type of material recovered would depend on several factors such as material being treated.
